

# TensorFlow Input Pipeline

CS 20SI:  
TensorFlow for Deep Learning Research  
Lecture 9  
2/10/2017

# Announcements

Assignment 2 is out. It's fun, but tricky. Start early!

No class next Wednesday (Feb 15) because of  
TensorFlow Dev Summit  
(sign up for live streaming party on campus)

Email me if you'd like to do IG for assignment 1

# Agenda

Data Readers Revisited

TFRecord

Variable Initializer

Graph Collection

Style Transfer

# Queues

tf.Session objects are designed to multithreaded  
→ can run ops in parallel

# Queues

Important TensorFlow objects for computing tensors **asynchronously** in a graph.

- Multiple threads prepare training examples and push them in the queue
- A training thread executes a training op that dequeues mini-batches from the queue

# Queues

Important TensorFlow objects for computing tensors  
**asynchronously** in a graph.

- All threads must be able to stop together
- Exceptions must be caught and reported
- Queues must be properly closed when stopping.

# Queues

TensorFlow queues can't run without proper threading,  
but threading isn't exactly pleasant in Python

# tf.Coordinator and tf.train.QueueRunner

- QueueRunner

create a number of threads cooperating to enqueue tensors in the same queue

# tf.Coordinator and tf.train.QueueRunner

- QueueRunner

create a number of threads cooperating to enqueue tensors in the same queue

- Coordinator

help multiple threads stop together and report exceptions to a program that waits for them to stop

Very similar to threadpool in CS110  
Don't worry if this sounds confusing.  
Example in a bit

# Queues

Queue	What's it?	Ops supported
tf.FIFOQueue	Dequeues elements in first in first out order	enqueue enqueue_many dequeue
tf.RandomShuffleQueue	Dequeues elements in a random order	enqueue enqueue_many dequeue
tf.PaddingFIFOQueue	FIFOQueue with padding to supports batching variable_size tensors	enqueue enqueue_many dequeue dequeue_many
tf.PriorityQueue	FIFOQueue whose enqueue and queue have another argument: priority	enqueue enqueue_many dequeue

# Queues

Client

```
q = tf.FIFOQueue(3, "float")  
init = q.enqueue_many([[0.,0.,0.]])
```

```
x = q.dequeue()  
y = x+1  
q_inc = q.enqueue([y])
```

```
init.run()  
q_inc.run()  
q_inc.run()  
q_inc.run()  
q_inc.run()
```

# Create a queue

```
tf.FIFOQueue(capacity, min_after_dequeue, dtypes,  
            shapes=None, names=None ...)
```

Same for other queues

# Queue example

09\_queue\_example.py

```
all_data = 10 * np.random.randn(N_SAMPLES, 4) + 1
all_target = np.random.randint(0, 2, size=N_SAMPLES)

queue = tf.FIFOQueue(capacity=50, dtypes=[tf.float32, tf.int32], shapes=[[4], []])

enqueue_op = queue.enqueue_many([all_data, all_target])
data_sample, label_sample = queue.dequeue()

qr = tf.train.QueueRunner(queue, [enqueue_op] * NUM_THREADS)
with tf.Session() as sess:
    # create a coordinator, launch the queue runner threads.
    coord = tf.train.Coordinator()
    enqueue_threads = qr.create_threads(sess, coord=coord, start=True)
    for step in xrange(100): # do to 100 iterations
        if coord.should_stop():
            break
        one_data, one_label = sess.run([data_sample, label_sample])
    coord.request_stop()
    coord.join(enqueue_threads)
```

# Queue example

```
# dummy data
```

```
all_data = 10 * np.random.randn(N_SAMPLES, 4) + 1
```

```
all_target = np.random.randint(0, 2, size=N_SAMPLES)
```

In practice, you can use any op to read in your data, even placeholder!

# Queue example

...

```
queue = tf.FIFOQueue(capacity=50, dtypes=[tf.float32, tf.int32], shapes=[[4], []])  
# create queue.  
# dtypes specifies types of data and label  
# shapes specifies shape of data and label
```

...

# Queue example

...

```
enqueue_op = queue.enqueue_many([all_data, all_target])  
data_sample, label_sample = queue.dequeue()
```

# a common practice is to enqueue all data at once, but dequeue one by one

...

# Queue example

...

```
qr = tf.train.QueueRunner(queue, [enqueue_op] * NUM_THREADS)
with tf.Session() as sess:
    # create a coordinator, launch the queue runner threads.
    coord = tf.train.Coordinator()
    enqueue_threads = qr.create_threads(sess, coord=coord, start=True)
    for step in xrange(100): # do to 100 iterations
        if coord.should_stop():
            break
        one_data, one_label = sess.run([data_sample, label_sample])
    coord.request_stop()
    coord.join(enqueue_threads)
```

....

You can use `data_sample` and `label_sample` to do all the training ops as if with placeholders

**Dequeue multiple elements?**

**tf.train.batch or tf.train.shuffle\_batch if you  
want to your batch to be shuffled**

I have never been able to get these  
to work with independent queues

Re: dequeue\_many is tricky with  
queues

# **tf.Coordinator**

Can be used to manage the threads you created without  
queues

# tf.Coordinator

```
import threading
```

```
# thread body: loop until the coordinator indicates a stop was requested.  
# if some condition becomes true, ask the coordinator to stop.
```

```
def my_loop(coord):  
    while not coord.should_stop():  
        ...do something...  
        if ...some condition...:  
            coord.request_stop()
```

Just like threadpool

Take CS110 for more threading fun!

```
# main code: create a coordinator.
```

```
coord = tf.Coordinator()
```

```
# create 10 threads that run 'my_loop()'
```

```
# you can also create threads using QueueRunner as the example above
```

```
threads = [threading.Thread(target=my_loop, args=(coord,)) for _ in xrange(10)]
```

```
# start the threads and wait for all of them to stop.
```

```
for t in threads: t.start()  
coord.join(threads)
```

# Data Readers

# Three ways to read in data

1. Through `tf.constant` (make everything a constant)

It'll seriously bloat your graph  
(you'll see in assignment 2)

# Three ways to read in data

1. Through `tf.constant` (make everything a constant)  
**NO**

2. Feed dict

Slow when client and workers are on  
different machines

# Three ways to read in data

1. Through `tf.constant` (make everything a constant)  
**NO**
2. Feed dict  
**MAYBE ...**
3. Data readers

# Data Readers

Readers allow us to load data directly into the worker process.

# Different Readers for different file types

`tf.TextLineReader`

Outputs the lines of a file delimited by newlines

E.g. text files, CSV files

`tf.FixedLengthRecordReader`

Outputs the entire file when all files have same fixed lengths

E.g. each MNIST file has 28 x 28 pixels, CIFAR-10 32 x 32 x 3

`tf.WholeFileReader`

Outputs the entire file content

`tf.TFRecordReader`

Reads samples from TensorFlow's own binary format (TFRecord)

`tf.ReaderBase`

To allow you to create your own readers

# Read in files from queues

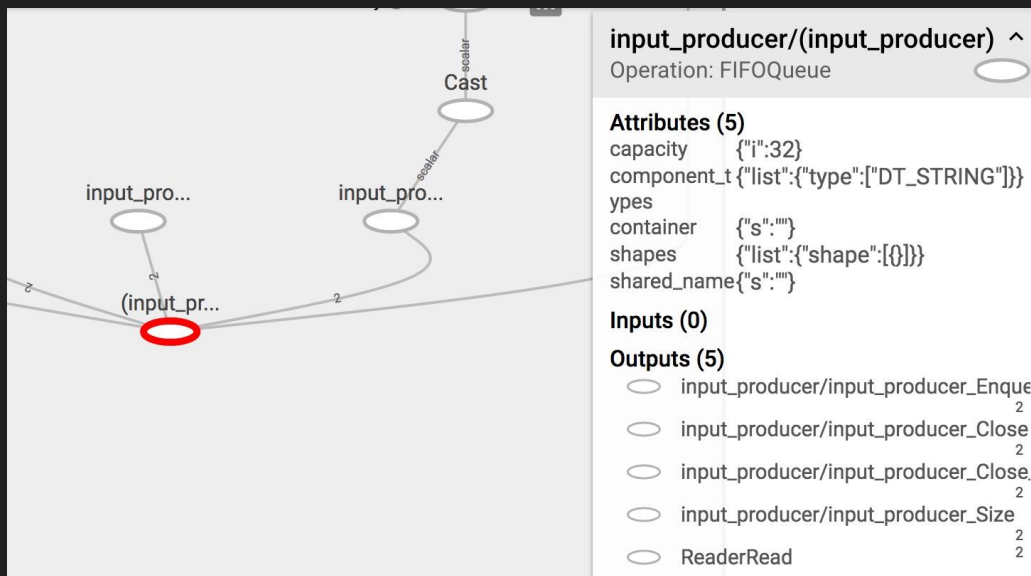

```
filename_queue = tf.train.string_input_producer(["file0.csv", "file1.csv"])  
  
reader = tf.TextLineReader()  
key, value = reader.read(filename_queue)
```

# Read in files from queues

```
filename_queue = tf.train.string_input_producer(["heart.csv"])
```

```
reader = tf.TextLineReader(skip_header_lines=1)  
key, value = reader.read(filename_queue)
```

string\_input\_producer is  
really a queue

# Read in files from queues

```
filename_queue = tf.train.string_input_producer(["heart.csv"])
```

```
reader = tf.TextLineReader(skip_header_lines=1)  
key, value = reader.read(filename_queue)
```

Need Coordinator and  
QueueRunner

```
with tf.Session() as sess:
```

```
    coord = tf.train.Coordinator()  
    threads = tf.train.start_queue_runners(coord=coord)  
    for _ in range(1): # generate 1 example  
        features, labels = sess.run([data_batch, label_batch])  
    coord.request_stop()  
    coord.join(threads)
```

# Read in files from queues

```
filename_queue = tf.train.string_input_producer(["heart.csv"])
```

```
reader = tf.TextLineReader(skip_header_lines=1)
key, value = reader.read(filename_queue)
```

```
with tf.Session() as sess:
```

```
    coord = tf.train.Coordinator()
```

```
    threads = tf.train.start_queue_runners(coord=coord)
```

```
    for _ in range(1): # generate 1 example
```

```
        key, value = sess.run([key, value])
```

```
        print valuee # 144,0.01,4.41,28.61,Absent,55,28.87,2.06,63,1
```

```
        print key # data/heart.csv:2
```

```
    coord.request_stop()
```

```
    coord.join(threads)
```

Value is just text. Need to  
convert to 2 tensors:

+ Features tensor

+ Label tensor

# Live example (o5\_csv\_reader.py)

# TFRecord

TensorFlow's binary file format

a serialized `tf.train.Example` protobuf object

# Why binary?

- make better use of disk cache
- faster to move around
- can store data of different types (so you can put both images and labels in one place)

# Convert normal files to TFRecord

- Super easy
- Live example

# Read in TFRecord

- Using TFRecordReader, duh
- Live example

# Assignment 2: Style Transfer

# Deadpool and Guernica

# Deadpool and Guernica

# Deadpool and Guernica

# Style Transfer

Not too much math,  
but implementation is tricky

# Mathy stuff

Find a new image:

- whose content is closest to the content image and
- whose style is closest to the style image

# It's all about the loss functions

- **Content loss**

To measure the content loss between the content of the generated image and the content of the content image

- **Style loss**

To measure the style loss between the style of the generated image and the style of the style image

**What is the content/style of an image?**

# Content/style of an image

Feature visualization have shown that:

- lower layers extract features related to content
- higher layers extract features related to style

# Loss functions revisited

- Content loss

To measure the content loss between **the feature map in the content layer** of the generated image and the content image

- Style loss

To measure the style loss between **the feature maps in the style layers** of the generated image and the style image

# Loss functions revisited

- Content loss

To measure the content loss between **the feature map in the content layer** of the generated image and the content image

Paper: 'conv4\_4'

- Style loss

To measure the style loss between **the gram matrices of feature maps in the style layers** of the generated image and the style image

Paper: ['conv1\_1', 'conv2\_1', 'conv3\_1', 'conv4\_1' and 'conv5\_1']

# Loss functions revisited

- Content loss

To measure the content loss between **the feature map in the content layer** of the generated image and the content image

Paper: `'conv4_4'`

- Style loss

To measure the style loss between **the gram matrices of feature maps in the style layers** of the generated image and the style image

Paper: `['conv1_1', 'conv2_1', 'conv3_1', 'conv4_1' and 'conv5_1']`

Give more weight to deeper layers

E.g. 1.0 for `'conv1_1'`, 2.0 for `'conv2_1'`, ...

# Loss functions revisited

- Content loss

$$\mathcal{L}_{content}(\vec{p}, \vec{x}, l) = \frac{1}{2} \sum_{i,j} (F_{ij}^l - P_{ij}^l)^2$$

- Style loss

$$E_l = \frac{1}{4N_l^2 M_l^2} \sum_{i,j} (G_{ij}^l - A_{ij}^l)^2$$

$$\mathcal{L}_{style}(\vec{a}, \vec{x}) = \sum_{l=0}^L w_l E_l$$

# Optimizer

Optimizes the initial image to minimize the combination of the two losses

$$\mathcal{L}_{total}(\vec{p}, \vec{a}, \vec{x}) = \alpha \mathcal{L}_{content}(\vec{p}, \vec{x}) + \beta \mathcal{L}_{style}(\vec{a}, \vec{x})$$

Do not optimize the weights!

# Tricky implementation details

1. Train input instead of weights

# Tricky implementation details

1. Train input instead of weights
2. Multiple tensors share the same variable to avoid assembling identical subgraphs
  - a. Content image
  - b. Style image
  - c. Initial image

# Tricky implementation details

1. Train input instead of weights
2. Multiple tensors share the same variable to avoid assembling identical subgraphs
3. Use pre-trained weights (from VGG-19)
  - a. Weights and biases already loaded for you
  - b. They are numpy, so need to be converted to tensors
  - c. Must not be trainable!!

# Next class (Friday 2/18)

RNNs!

Example: translate

Feedback: [huyenn@stanford.edu](mailto:huyenn@stanford.edu)

Thanks!
